

Vol. 100, December 2005

Immunocytochemical detection of poly- γ -glutamate (γ PGA) expressed in tobacco leaf tissues.

Left panel, Whole mount staining of leaf containing parts transformed with control vector (left) or a mixture of *pgsA*, *pgsB*, and *pgsC* *Agrobacterium* strains (right) separated by a vein. Right panel, Cross-section of leaf (4 μ m thick) transformed with a mixture of *pgsA*, *pgsB*, and *pgsC* *Agrobacterium* strains.

The *pgsA*, *pgsB*, and *pgsC* form the γ PGA synthetase system (*pgs*) complex. These immunocytochemical results indicate that the *pgs* complex expressed transiently in tobacco tissues could produce sufficient γ PGA.
