

**Vol. 111 (January–June 2011)**

Photomicrograph of neuronal cells projected from an attached embryoid body (EB) of mouse ES cells.  $\beta$ III-tubulin, a neuron-specific marker, was stained with Alexa Fluor 594.  $\beta$ III-tubulin-positive cells more abundantly developed from the EBs grown in 5.5 mM glucose than from the EBs grown in 20 mM glucose.
